Stephen R. Carter, M.S.
Industry

Steve Carter has been making notable contributions to his chosen field ever since he received his B.S. in Computer Science from BYU nearly 30 years ago. At Eyring Research he was a key player in developing a new automated magnetic tape manufacturing system for 3M, and while at WordPerfect he lead numerous innovative product development projects. During the rise of the Internet, his expertise was called upon to help create world standards for the World Wide Web, and today as the most prolific inventor in Novell's history, Steve continues to play a leading role in that domain. He was the chief architect responsible for the system that allows for the management of thousands of internet caching devices, and his security inventions allow for the protection and controlled access of cached information. The State of Utah uses this system to accelerate and filter web content, providing the children in our public schools with a fast, reliable and safe internet.
